

LETTER OF RECOMMENDATION

To Whom It May Concern,

Kevin joined our team for a 10-week internship, and I will be direct: he is one of the stronger interns I have worked with.

His main project was building a sentiment analysis dashboard tracking public discourse around National Service on Reddit. On paper, that is a reasonably scoped NLP task. In practice, Kevin turned it into something much more substantive. He did not just get the thing working, he kept pushing on it. When the model was not performing the way he wanted, he would go away, dig into the problem himself, and come back with a considered approach rather than just asking to be told what to do. That kind of self-directed problem solving is genuinely rare, especially at the intern level. He showed real technical creativity in how he approached improving model accuracy, going beyond the obvious methods to think more carefully about what would actually move the needle.

What struck me most was that he completed all of this with two weeks of the internship still to go. Rather than coast, he used that time to build a proof-of-concept for an AI voice calling agent for telephone interviews, a completely different technical domain that he picked up and ran with on his own initiative. And true to form, he did not just put together something rough to tick a box. He kept thinking about how to sharpen it, how to make it something we could genuinely show to stakeholders and build a real case for taking further. That instinct to think beyond the immediate task and towards actual impact is not something you can teach.

Kevin is the kind of person who makes work easier for the people around him, because you can trust him to own a problem fully. I would work with him again without hesitation.
